

MDCT of the chest: Pulmonary embolism and acute aortic disease

劉原彰 醫師
影像診療科部 急重症影像診療科
長庚紀念醫院 林口總院

大綱

- MDCT 在急診胸痛病人扮演角色
- MDCT : imaging of pulmonary embolism
- MDCT: imaging of aortic dissection
- MDCT: imaging of the heart
 - non-ECG gated CT imaging
 - ECG-gated cardiac CTA
- Update from 64-slice CT to 320-slice CTA

- 至少一半以上急診胸痛病患是沒有心臟方面疾病

- Triple rule-out CT 可以快速找出病因。

- Chest pain:

 - Stable angina

 - Pulmonary embolism (PE)

 - Aortic dissection.

 - Acute coronary syndrom

 - transmural myocardial infarction (MI)

 - subendocardial MI

 - unstable angina

Acute aortic dissection

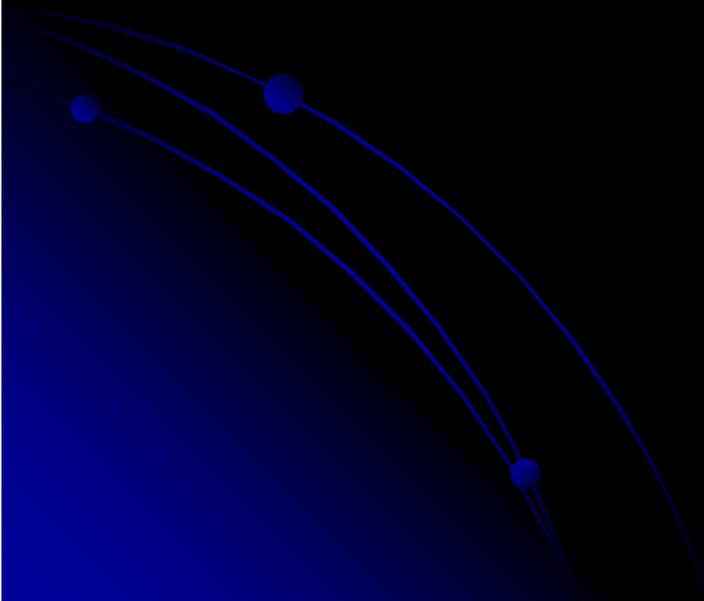

- tearing aortic pain with immediate onset, unequal extremity pulses or blood pressures, and mediastinal widening on chest radiograph.
- 4%–7% of patients with aortic dissection may have none of these findings
- CT identified 99% acute aortic disorders, including dissection, intramural hematoma, penetrating aortic ulcer, new or enlarging aneurysm, or acute aortic rupture.
Radiology. 2006;238:841–852.

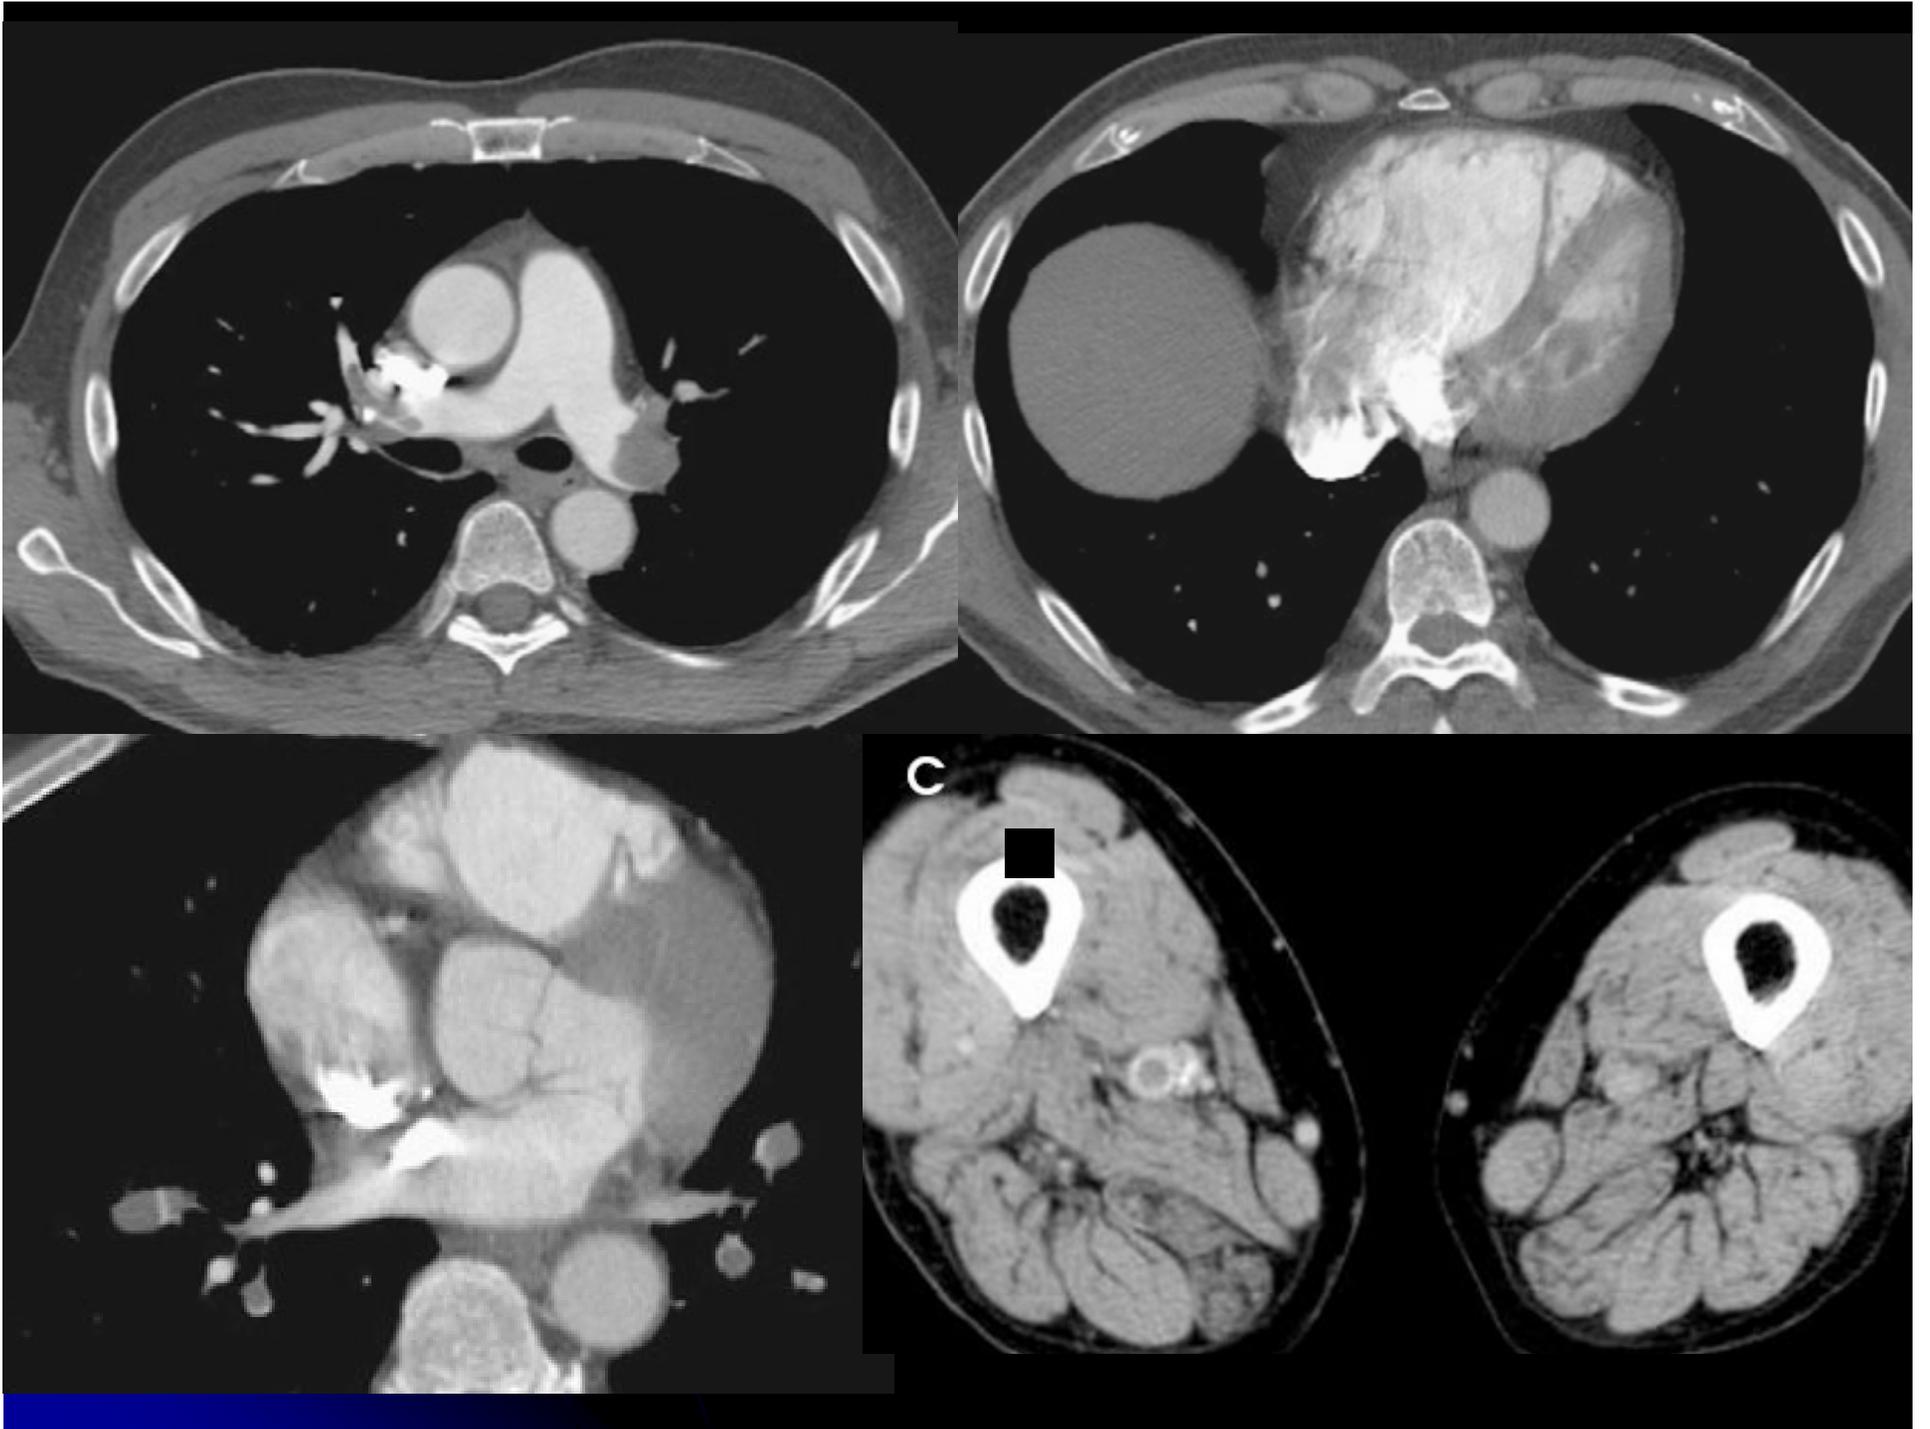

Pulmonary embolism

- Clinical scoring systems such as the Wells and Geneva scores can be used to risk stratify patients suspected of having PE, but they are insufficient to exclude the diagnosis alone.
- Diagnostic imaging strategies include ventilation-perfusion scanning, lower extremity sonography, CT pulmonary angiography (CTPA), and conventional pulmonary angiography (CPA).
- Among these methods, CTPA has become the first line tool for evaluation of PE in the acute setting.

- 4-slice CTPA with CPA in 93 patients, the sensitivity and specificity of CTPA were 100% and 89%, respectively. *Radiology*. 2004;233:806–15.

Acute coronary syndrome

- ACS encompasses a spectrum of presentations ranging from unstable angina to acute MI.
- 診斷ACS: clinical history, electrocardiogram (ECG), and cardiac enzymes.
- 大多數胸痛病患 normal ECG and cardiac enzymes. 主要都在觀察病情變化, 僅15%是真正ACS.
- 2~5% 真的ACS沒診斷出來
- 因此需要更快速而且精準的檢查

第一類

- 很明顯是 ACS.

The ECG is abnormal

The cardiac biomarkers are elevated,
clinical history → high risk for coronary
artery disease.

- This group of patients is typically sent directly to the cardiac catheterization laboratory.

第二類

- have minimal risk for coronary artery disease and a reasonable explanation for the chest pain

例如: musculoskeletal injury

- 這類病患可以 discharged home without further work-up.

第三類 佔50%左右

- equivocal findings on the chest pain work-up.
- 一開始的時候
- The history may be atypical,
- the ECG nonspecific or normal,
- the cardiac biomarkers may be normal,
- In this large group of patients, noninvasive imaging may be useful for clarifying the diagnosis.

影像檢查

- **Radionuclide myocardial perfusion imaging**
high negative predictive value (99%) for ACS.
通常僅在正常時間內服務
對其他胸痛原因無法釐清
- **echocardiography.**
急診available
sensitivity for ACS is good (90%)
specificity is comparatively poor (53% for MI, 78% for ischemia).
主要看wall motion abnormality, 無法區分新舊
- **Magnetic resonance imaging (MRI)**
- **multidetector cardiac CT.**

- Radionuclide myocardial perfusion imaging

- echocardiography.

- Magnetic resonance imaging (MRI)

ability to evaluate myocardial perfusion, function, and viability.

- contrastenhanced, resting cardiac MRI had a sensitivity of 84% and a specificity of 85% for the diagnosis of ACS.

- 缺點：轉運，檢查時間長，and the incompatibility of MRI with pacemakers, implantable cardioverter-defibrillators, and other metallic devices.

- Multidetector cardiac CT.

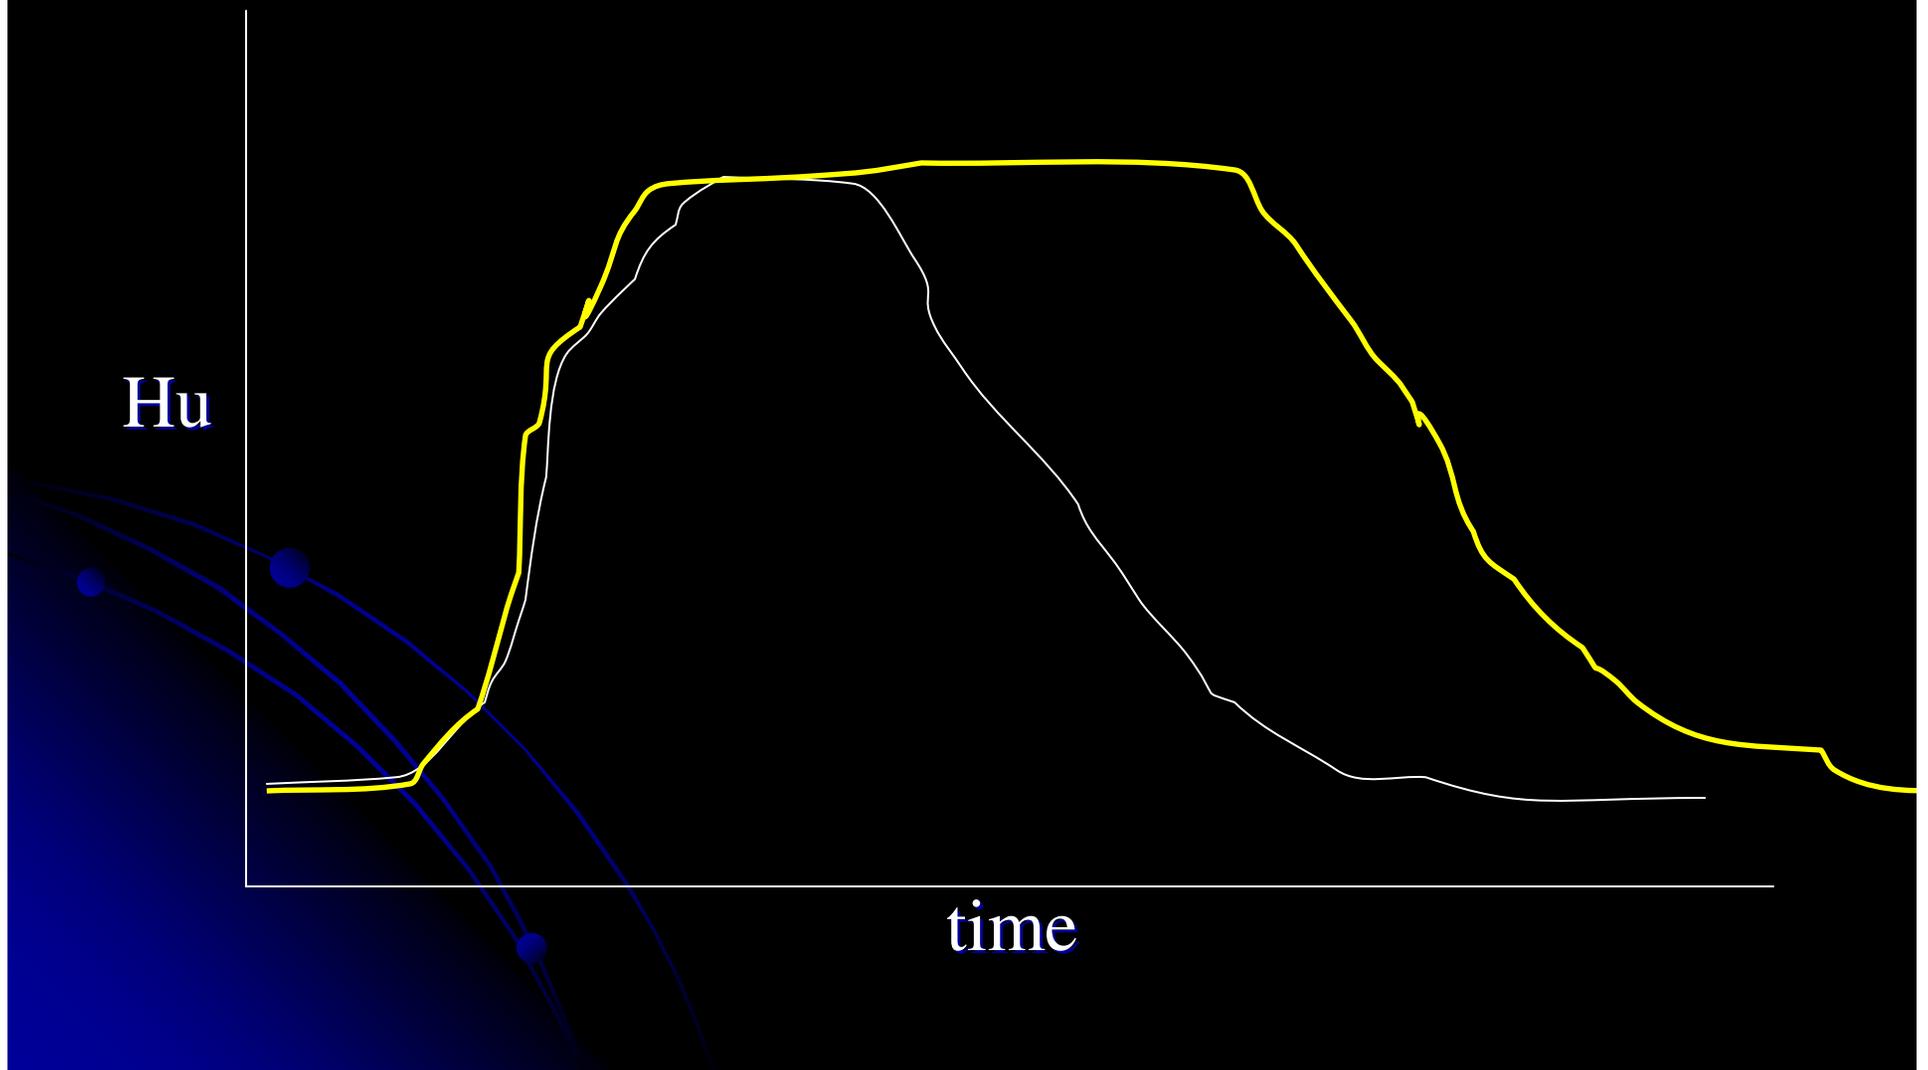

Multidetector cardiac CT

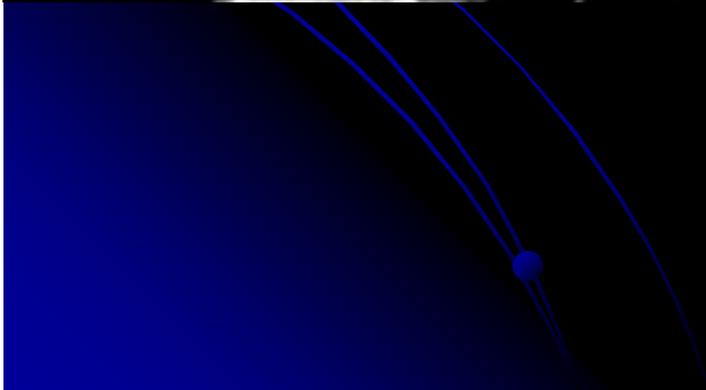

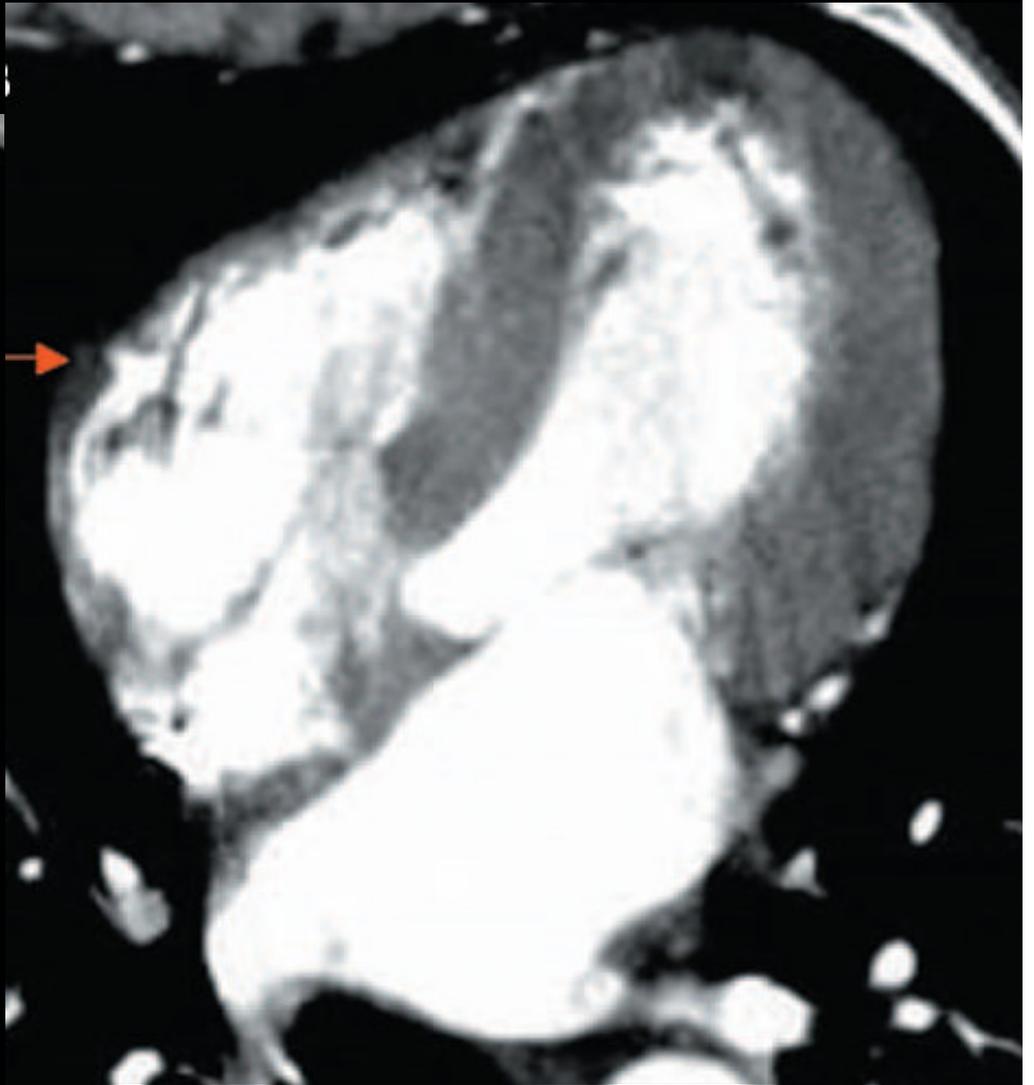

- coronary artery disease, aortic dissection, and PE.
- 也可以同時診斷: pneumonia, pneumothorax, esophageal rupture, tumor.

Table 2. Emergency department (ED) triage guidelines

Risk category	CT interpretation	Clinical guideline
Negative study	Normal scan	Discharge from ED; follow-up with personal physician.
Low	Coronary calcium score <100	Discharge from ED; follow-up with preventive cardiologist.
Intermediate	Coronary calcium score 100–400 Stenosis 30% to 70% in any vessel	Cardiology consultation in ED; discharge from ED or admission to hospital at cardiologist's discretion.
High	Coronary calcium score >400 Hard or soft plaque Stenosis >70% in any vessel Stenosis >50% in left main	Admission to hospital

顯影劑 濃度與時間關係

Triple rule-out CT 的挑戰

- 輻射劑量
- 顯影劑施打的注射量(腎功能)
- 掃描時間點
- 閉氣時間較長
- 影像解析度
- 心律變化,心跳速率控制.

- 320-slice CT 有可能可以解決上述問題

- 照相技術師 + 護士 + 判讀醫師 → 必須能夠24Hr available

Conclusion

- Diagnostic accuracy for the detection of acute aortic dissection and PE are equivalent or superior to competing methods.
- For ACS, CT coronary angiography has an excellent negative predictive value.
- Given the prevalence of chest pain and the considerable radiation dose from CT, clinical tools that can reliably exclude life-threatening causes of chest pain should be rigorously applied to avoid unnecessary imaging.
